With exponential growth of the global population and marked rises in meat consumption per capita, demands for animal-source protein are expected to increase 72% between 2013 and 2050. This raises concerns about the sustainability and environmental impacts of animal agriculture. An attractive solution to meeting increasing needs for animal products and mitigating undesirable effects of agricultural practices is to enhance the efficiency of animal growth, reproduction, and lactation. Currently, there is no resource that offers specific knowledge of both animal science and technology, including biotechnology for the sustainability of animal agriculture for the expanding global demand of food in the face of diminishing resources. This book fills that gap, giving readers all the necessary information on important issues facing modern animal agriculture, namely its sustainability, challenges and innovative solutions. Integrates new knowledge in animal breeding, biotechnology, nutrition, reproduction and management Addresses the urgent issue of sustainability in modern animal agriculture Provides practical solutions on how to solve the current and future problems that face animal agriculture worldwide This work has been selected by scholars as being culturally important, and is part of the knowledge base of civilization as we know it. When you're looking for a comprehensive and reliable text on large animal reproduction, look no further! the seventh edition of this classic text is geared for the undergraduate student in Agricultural Sciences and Veterinary Medicine. In response to reader feedback, Dr. Hafez has streamlined and edited the entire text to remove all repetitious and nonessential material. That means you'll learn more in fewer pages. Plus the seventh editing is filled with features that help you grasp the concepts of reproduction in farm animals so you'll perform better on exams and in practice: condensed and simplified tables, so they're easier to consult an easy-to-scan glossary at the end of the book an expanded appendix, which includes graphic illustrations of assisted reproduction technology Plus, you'll find valuable NEW COVERAGE on all these topics: Equine Reproduction: expanded information reflecting today's knowledge Llamas (NEW CHAPTER)

Many genes have been cloned from chicken cells, and during the next decade numerous laboratories will be concentrating their resources in developing ways of using these tools. Manipulation of the Avian Genome contains the most recent information from leading research laboratories in the areas of developmental and molecular genetics of the chicken. This information was presented at the Keystone Symposium held at Lake Tahoe in March, 1991. The book discusses potential applications of emerging technology in basic science and poultry production. Various techniques for altering genomic DNA, such as microinjection, retroviral vectors, and lipofection are covered. Genome evaluation using DNA fingerprinting and conventional breeding techniques are presented. There is increasing interest in the biology of domestic animals ranging from genomics, transcriptomics, metabolomics, nutritional physiology, and systems biology. This book touches on all of these, with a particular focus on topics such as domestic animals as comparative models to humans, molecular regulation of growth, metabolic efficiency, reproduction, and the impact of stress on growth and development. The book concludes with a discussion on the current and future directions for researchers. Photographs, drawings, and text on two different levels of difficulty follow the development of a chick embryo from the fertilization and laying of the egg to the time the chick hatches. Poultry Meat and Egg Production has been prepared primarily for use as a text for students taking their first courses in poultry management. The general overall science and production practices currently in use in the industry have been characterized and described so that the student can gain insight into the industry. Reading portions of chapters before the lecture discussions and laboratory sessions will be helpful in giving students an understanding of the material. Also, this gives the instructor an opportunity to emphasize in the lectures areas of current concern in the industry, and to present topics of his or her choice in greater detail. We wish to acknowledge and thank the following scientists who reviewed and critically evaluated the several chapters and made many helpful suggestions: Dr. Bobby Barnett, Clemson University; Mr. D. O. Bell, University of California; Dr. Donald Bray (retired), University of Illinois; Dr. W. H. Burke, University of Georgia; Dr. Frank Cherms, Nicholas Turkey Breeding Farms, Inc., Sonoma, California; Dr. Wendell Carlson (retired), South Dakota State University; Dr. J. V. Craig, Kansas State University; Dr. K. Goodwin (retired), Pennsylvania State University; Dr. T. L. Goodwin, University of Arkansas; Dr. G. C. This book reviews the biological science and background to breeding meat poultry, specifically broiler, turkey and duck. These commercial birds have been changed by genetic selection to such an extent that they are substantially different from traditional breeds and laying hens. Covering science, management and husbandry systems, this book is an essential reference for researchers and students in animal science, as well as technical staff of breeding companies and poultry meat producers. Excerpt from Dollars and Sense in the Poultry Business A student of this school, living in Canada. Started raising a few chickens in a made-over chicken shed in his back yard. He invested only in poultry to start with. He kept track of every dollar's worth of expense, every dime's worth of feed, etc. He cared for his hens and fed them just as we told him to do in the lesson books of his course. This student made a clear profit in one year of per hen, besides increasing the value of the chickens and houses on hand. Thousands of our students have recently written us in detail showing they have made from two to twenty times as much cash profit as ever before. Some of these are only raising a few dozen in their back yard; others raise from one to five thousand per year. Some, in fact most of these people, were losing money from poultry one, two or three years ago, but with the knowledge they gained from our books and teachings added to the better money making poultry conditions, these same students are now making big money. Avian incubation is a critical part of reproduction and was extensively covered in the OUP book 'Avian Incubation' published in 2002. This new book updates the older one by introducing new concepts that have

arisen over the intervening years as well as updating key areas of research. The new book does not replace 'Avian Incubation' but, rather, reinforces and supplements it. Therefore, this book covers four key areas: nest, eggs, incubation, and the study of avian reproduction. It collates and describes a range of recent developments in avian reproduction and brings the field right up to date. Avian Immunology, Third Edition contains a detailed description of the avian innate immune system, encompassing the mucosal, enteric, respiratory and reproductive systems. The diseases and disorders it covers, include immunodepressive diseases and immune evasion, autoimmune diseases, and tumors of the immune system. Practical aspects of vaccination are examined as well. Extensive appendices summarize resources for scientists including cell lines, inbred chicken lines, cytokines, chemokines, and monoclonal antibodies. With contributions from the foremost international experts in the field, Avian Immunology 3rd, provides the most up-to-date crucial information not only for poultry health professionals and avian biologists, but also for comparative and veterinary immunologists, graduate students and veterinary students with an interest in avian immunology. Avian Immunology, Third Edition, is a fascinating and growing field and surely provides new and exciting insights for mainstream immunology in the future. Reflects significant advances in the field since the second edition, particularly the explosion of knowledge on genomics including work on the chicken, turkey and zebra finch genomes Provides a single source reference ranging from the basic science to cutting edge research Provides practical information for veterinarians particularly those specialised in poultry or companion bird medicine New chapters on the impact of the microbiome on the immune system, defence mechanisms in the egg and embryo and emerging transgene technologies Poultry is an integral part of animal agriculture, and they provide the human population with products such as meat and eggs. In poultry production, as with other livestock systems, a high level of reproductive performance is absolutely crucial to efficient production. In order to manage poultry reproduction and the specific problems that arise, it is important to understand the underlying physiology of the reproductive process. Thus, this book aims to provide an integrated overview of the subject of poultry reproduction, describing the normal function of the reproductive system. The book is designed to provide a general background to the field of poultry reproduction for postgraduate and undergraduate students, and a reference source for research scientists and professional workers in the field related to the production of animal products. The book will serve as an introductory text to veterinary students embarking on a career in reproductive physiology research. Furthermore, we hope that it will be used by working veterinarians and farmers to update themselves on new research findings and developments in the management of poultry reproduction. Since the mid the 19th century, several studies characterizing the anatomy and physiology of the male and female reproductive systems of poultry have been conducted. This book focuses mainly on the review of current literature on physiological mechanisms regulating reproduction with emphasis on poultry species. It describes the basic structures and functions of the male and female reproductive tracts including the sex organs (testis, ovary), excurrent ducts, accessory organs, oviducts, shell gland and vagina. The endocrine glands that control reproduction in poultry were also described. The process of sperm production and egg formation are discussed including highlights of the recent literature on factors that affect spermatozoa production and function. The basic fundamental structure and chemical characteristics of the eggs were defined. Key elements of the egg production are discussed including synthesis and transfer of egg yolk constituents, the formation of the egg yolk in the ovary, development of oocytes and ovulation, the formation of egg white and chalazae, the formation of eggshell and oviposition. This section also described in detail the sperm-egg binding, sperm acrosome reaction and protease enzymes required for the hole formation in the perivitelline membrane and the development of the diploid zygote emanated from the fusion of the nuclei from both male and female gametes. The editors have succeeded in bringing together many renowned poultry reproduction experts to review the current body of knowledge in poultry reproduction and are grateful to all the authors for their state of the art compilation of the most recent development in this field. We feel that we have achieved our goal of producing an outstanding book, with the top scientists in their field addressing each subtopic. I.P. Ogbuewu I.C. Okoli M.U. Iloje Excerpt from Profitable Poultry Farming The sale of the first edition has been simply wonderful; and I believe that much benefit has come out of it for the novice. There are a number of valuable changes in this edition, but practically the work is the same. The author. This book describes the biological basis of reproduction in poultry and places this information in the context of poultry production. The author has collated and integrated recent information from a variety of sources in order to highlight the principles of the reproductive biology of poultry. This is achieved through a well-illustrated and tabulated text which emphasizes integration rather than comprehensive literature citations. The book begins by considering the egg, proceeds to a brief description of embryonic and chick development as they relate to poultry production, and describes the physiological processes that lead to formation of the fertile egg. It concludes with a discussion of the relationship between measurements of reproductive success that are commonly used in the poultry industry and their ability to reflect the physiological processes that contribute to successful reproduction. The book is aimed at advanced undergraduates or graduate students studying animal reproduction or agriculture, as well as scientists working in the poultry industry. Continued genetic development of pigs and poultry has been the foundation of profitable production within a competitive market. However, the challenges of these production increases have undoubtedly taken their toll on reproductive function in all breeding livestock, with the incidence of infertility increasing at an alarming rate. For example, it has recently been estimated that over 40% of sows are culled due to fertility problems, compared to just 12% with feet and leg issues. This edited collection of papers is taken from a series of seminars, devoted to bringing together some of the world's leading authorities in the field of pig and poultry reproduction. The fundamental aim being to re-examine the current trends in productivity in the pig and poultry industries, and to identify nutritional means to improve fertility. It considers the effects of essential nutrients in optimising productivity, and discusses innovative applications of nutrition that will help to enhance fertility. The success of such innovations within entrepreneurial integrated systems is also covered, together with the importance of producing a quality chick and piglet at birth/hatching. Finally, the role of management and the need for least cost production is discussed. Nutritional Approaches to Arresting the decline in Fertility of Pigs and Poultry is aimed at nutritionists and animal producers as well as students and researchers studying animal and applied biological sciences. A major economic loss in the poultry industry is the large number of infertile eggs among those eggs produced for hatching purposes. Major studies have been undertaken to establish production procedures to minimize infertility, especially in females. Male fertility rapidly declines with age causing some breeder males to be replaced in mid-season. It is common practice to raise breeder cockerels together with breeder pullets since their requirements have been assumed to be the same. However, very little research has been undertaken to study the requirements of cockerels for optimum reproduction performance. Restriction of nutrients to reduce growth in pullets has been practiced for many years. The purpose of this restriction is to delay sexual maturity, reduce mortality, and increase initial egg size with more uniform size during the laying period. This has been accomplished with no permanent effect on fertility. The purpose of this research was to study the effect of one type of feed restriction, low dietary protein levels during the growing period, upon development of the reproductive system of cockerels as indicated by subsequent reproductive performance and morphology of the testes. The Sixth Edition is thoroughly revised and updated, and features several new chapters with entirely new content on such topics as migration, genomics and epigenetics. Chapters throughout have been greatly expanded due to the many recent advances in the field. The text also covers the physiology of flight, reproduction in both male and female birds, and the immunophysiology of birds. The Sixth Edition, like the earlier editions, is a must for anyone interested in comparative physiology, poultry science, veterinary medicine, and related fields. This volume establishes the standard for those who need the latest and best information on the physiology of birds. Includes new chapters on endocrine disruptors, magnetoreception, genomics, proteomics, mitochondria, control of food intake, molting, stress, the avian endocrine system,

bone, the metabolic demands of migration, behavior and control of body temperature Features extensively revised chapters on the cardiovascular system, pancreatic hormones, respiration, pineal gland, pituitary gland, thyroid, adrenal gland, muscle, gastro-intestinal physiology, incubation, circadian rhythms, annual cycles, flight, the avian immune system, embryo physiology and control of calcium. Stands out as the only comprehensive, single volume devoted to bird physiology Offers a full consideration of both blood and avian metabolism on the companion website (<http://booksite.elsevier.com/9780124071605>). Tables feature hematological and serum biochemical parameters together with circulating concentrations of glucose in more than 200 different species of wild birds "Bioactive Food Peptides in Health and Disease" highlights recent developments on bioactive food peptides for the promotion of human health and the prevention/management of chronic diseases. The book provides a comprehensive revision of bioactive peptides obtained from both animal and plant food sources. Aspects related to their bioactivity, mechanism of action, and bioavailability are extensively described along the different chapters. Also, the chapters describe the impact of bioactive peptides on the physiological absorption, regulation and disease prevention. The book also covers the recent technological advances for the production of food peptides. Bioactive Food Peptides in Health and Disease provides updated and interesting information, being a good reference book for nutritional and food scientists, biochemists, industry producers, and consumers. This authoritative textbook provides an introduction and guide to poultry behavior and welfare. It describes the origin and biology of the various species of bird that are of agricultural importance, as well as giving a succinct overview of their key behavior patterns. There is careful discussion of the many factors that influence their welfare, and detailed consideration of the ways in which legislation and commercial interests interact in an attempt to satisfy the many needs involved. The final chapters discuss possible future developments within the subject. The book is in part an update of a previous work, Poultry Production Systems: Behaviour, Management and Welfare (CABI, 1992), completely rewritten and with much new material added.
